# IMAGE PREDICTION BASED ON <br> <br> NON-NEGATIVE MATRIX <br> <br> NON-NEGATIVE MATRIX FACTORIZATION 

## Mehmet TÜRKAN Christine GUILLEMOT

IEEE Int. Conf. on Acoustics, Speech and Signal Processing
May 22-27, 2011
Prague, Czech Republic

## AGENDA

## Problem Addressed

Prior work on Image Prediction
... Template Matching
... Sparse Approximations
A new approach based on ... Non-negative Matrix Factorization
Experimental Results
conclusion

## CLOSED-LOOP IMAGE PREDICTION

H.264/AVC Intra Prediction
$\checkmark$ homogeneous regions
$\checkmark$ contours (if any of modes support the orientation)
$x$ more complex structures and textural regions

## CLOSED-LOOP IMAGE PREDICTION

H.264/AVC Intra Prediction
$\checkmark$ homogeneous regions
$\checkmark$ contours (if any of modes support the orientation)
$x$ more complex structures and textural regions

Template Matching
$\checkmark$ to cope with the H.264/AVC intra prediction lacks

centre de recherche RENNES - BRETAGNE ATLANTICUE

## CLOSED-LOOP IMAGE PREDICTION

H.264/AVC Intra Prediction
$\checkmark$ homogeneous regions
$\checkmark$ contours (if any of modes support the orientation)
$x$ more complex structures and textural regions

Template Matching
$\checkmark$ to cope with the H.264/AVC intra prediction lacks
Sparse Approximations
$\checkmark$ a generalization of template matching
$\square$ centre de recherche
RENNES - BRETAGNE ATLANTICUE

## H.264/AVC INTRA PREDICTION

Propagating pixel values along a specified direction using prior encoded samples from spatially neighbouring pixels

## H.264/AVC INTR A PREDICTION

Propagating pixel values along a specified direction using prior encoded samples from spatially neighbouring pixels
$\checkmark$ Intra-16x16 with 4 prediction modes (DC +3 directional)

3 (plane)

## H.264/AVC INTR A PREDICTION

Propagating pixel values along a specified direction using prior encoded samples from spatially neighbouring pixels
$\checkmark$ Intra-16x16 with 4 prediction modes (DC +3 directional)

$\checkmark$ Intra-4x4 with 9 prediction modes
(DC +8 directional)

$\square$ centre de recherche
RENNES - BRETACNE ATLANTICUE

## TEMPLATE MATCHING

The best candidate block is selected with
$\checkmark$ the minimum distance between template and candidate block neighbourhood
$\square$
et en automatique
centre de recherche
RENNES - BRETAENE ATLANTICUE

## TEMPLATE MATCHING - EXAMPLE

An additional prediction mode in H.264/AVC (Intra-4x4)
$\checkmark$ up to $11.3 \%$ bit-rate saving (Tan et al. ICIP'06)

## TEMPLATE MATCHING - EXAMPLE

An additional prediction mode in H.264/AVC (Intra-4x4)
$\checkmark$ up to $11.3 \%$ bit-rate saving (Tan et al. ICIP'06)
Averaging multiple predictors (larger and directional template)
$\checkmark$ more than $15 \%$ bit-rate saving (Tan et al. CCNC'07)
$\square$
et en automatique
centre de recherche
RENNES - BRETAENE ATLANTICUE

## SPARSE PREDICTION

A linear combination approximation of the template
$\checkmark$ weighting coefficients are calculated with a greedy sparse approximation algorithm such as OMP

$I N R I A$
centre de recherche
RENNES - BRETAGNE ATLANTICUE

## NOTATION

$\overrightarrow{\mathrm{b}} \in \mathbf{R}^{\mathrm{N}}$
: stacked sample values of region $S=B U C$
$\overrightarrow{\mathrm{b}}_{\mathrm{c}}$ : compacted data vector (support region C) $\mathrm{b}_{\mathrm{t}}$ : actual values of the current block $B$

## NOTATION

$\mathrm{A} \in \mathbf{R}^{\mathrm{N} \times \mathrm{M}}$ : stacked luminance values of all patches in W
$\mathrm{A}_{\mathrm{c}}$ : compacted dictionary (corresponds to region C)
$A_{t}$ : compacted dictionary (corresponds to region $B$ )
$\square$

## SPARSE PREDICTION

Support region approximation with a constraint:

$$
\begin{aligned}
\overrightarrow{\mathrm{x}}_{\text {opt }}=\min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} & \text { subject to } \\
& \min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{t}}-\mathrm{A}_{\mathrm{t}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} \text { and }\|\overrightarrow{\mathrm{x}}\|_{0} \leq \mathrm{K}
\end{aligned}
$$

## SPARSE PREDICTION

Support region approximation with a constraint:

$$
\begin{aligned}
\overrightarrow{\mathrm{x}}_{\text {opt }}=\min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} & \text { subject to } \\
& \min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{t}}-\mathrm{A}_{\mathrm{t}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} \text { and }\|\overrightarrow{\mathrm{x}}\|_{0} \leq \mathrm{K}
\end{aligned}
$$

The selected sparsity level needs to be transmitted so that the decoder can exactly do the same prediction

## SPARSE PREDICTION

Support region approximation with a constraint:

$$
\begin{aligned}
\overrightarrow{\mathrm{x}}_{\text {opt }}=\min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} & \text { subject to } \\
& \min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{t}}-\mathrm{A}_{\mathrm{t}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} \text { and }\|\overrightarrow{\mathrm{x}}\|_{0} \leq \mathrm{K}
\end{aligned}
$$

The selected sparsity level needs to be transmitted so that the decoder can exactly do the same prediction

The predicted signal: $\hat{b}_{t}=A_{t} \vec{x}_{\mathrm{opt}}$

## NON-NEGATIVE MATRIX FACTORIZATION

NMF: Low-rank representation of high-dimensional data

- Dimensionality reduction
- Data mining
- Noise removal

## NON-NEGATIVE MATRIX FACTORIZATION

Given a non-negative matrix $B \in \mathbf{R}^{\mathrm{N} \times \mathrm{L}}$ and $\mathrm{M}<\min (\mathrm{N}, \mathrm{L})$ NMF tries to find matrix factors $A \in \mathbf{R}^{\mathrm{N} \times \mathrm{M}}$ and $\mathrm{X} \in \mathbf{R}^{\mathrm{M} \times \mathrm{L}}$

## NON-NEGATIVE MATRIX FACTORIZATION

Given a non-negative matrix $\mathrm{B} \in \mathbf{R}^{\mathrm{N} \times \mathrm{L}}$ and $\mathrm{M}<\min (\mathrm{N}, \mathrm{L})$ NMF tries to find matrix factors $\mathrm{A} \in \mathbf{R}^{\mathrm{N} \times \mathrm{M}}$ and $\mathrm{X} \in \mathbf{R}^{\mathrm{M} \times \mathrm{L}}$

$$
\min _{A, X}\left[\frac{1}{2}\|\mathrm{~B}-\mathrm{AX}\|_{\mathrm{F}}^{2}\right] \text { subject to } \mathrm{A} \geq 0, \mathrm{X} \geq 0
$$

## NON-NEGATIVE MATRIX FACTORIZATION

Given a non-negative matrix $B \in \mathbf{R}^{\mathrm{N} \times \mathrm{L}}$ and $\mathrm{M}<\min (\mathrm{N}, \mathrm{L})$ NMF tries to find matrix factors $A \in \mathbf{R}^{\mathrm{N} \times \mathrm{M}}$ and $\mathrm{X} \in \mathbf{R}^{\mathrm{M} \times \mathrm{L}}$

$$
\min _{A, X}\left[\frac{1}{2}\|B-A X\|_{F}^{2}\right] \text { subject to } A \geq 0, X \geq 0
$$

Multiplicative update equations [Lee and Seung, 2000]

$$
\mathrm{X}_{\mathrm{a}, \mathrm{\mu}} \leftarrow \mathrm{X}_{\mathrm{a}, \mu} \frac{\left(\mathrm{~A}^{\mathrm{T}} \mathrm{~B}\right)_{\mathrm{a}, \mu}}{\left(\mathrm{~A}^{\mathrm{T}} \mathrm{AX}\right)_{\mathrm{a}, \mu}+10^{-9}} \quad \text { and } \quad \mathrm{A}_{\mathrm{i}, \mathrm{a}} \leftarrow \mathrm{~A}_{\mathrm{i}, \mathrm{a}} \frac{\left(\mathrm{BX}^{\mathrm{T}}\right)_{\mathrm{i}, \mathrm{a}}}{\left(\mathrm{AXX}^{\mathrm{T}}\right)_{\mathrm{i}, \mathrm{a}}+10^{-9}}
$$

## IMAGE PREDICTION BASED-ON NMF

We can write NMF cost function in the vector form

$$
\min _{\mathrm{A}, \overrightarrow{\mathrm{x}}}\left[\frac{1}{2}\|\overrightarrow{\mathrm{~b}}-\mathrm{A} \overrightarrow{\mathrm{x}}\|_{2}^{2}\right] \quad \text { subject to } \mathrm{A} \geq 0, \overrightarrow{\mathrm{x}} \geq 0
$$

## IMAGE PREDICTION BASED-ON NMF

We can write NMF cost function in the vector form

$$
\min _{\mathrm{A}, \overrightarrow{\mathrm{x}}}\left[\frac{1}{2}\|\overrightarrow{\mathrm{~b}}-\mathrm{A} \overrightarrow{\mathrm{x}}\|_{2}^{2}\right] \quad \text { subject to } \mathrm{A} \geq 0, \overrightarrow{\mathrm{x}} \geq 0
$$

Idea: Fix A and b ,

## dictionary construction

$\mathrm{A} \in \mathbf{R}^{\mathrm{N} \times \mathrm{M}}$ : stacked luminance values of all patches in W
$\mathrm{A}_{\mathrm{c}}$ : compacted dictionary (corresponds to region C)
$A_{t}$ : compacted dictionary (corresponds to region $B$ )
$\square$

## IMAGE PREDICTION BASED-ON NMF

We can write NMF cost function in the vector form

$$
\min _{\mathrm{A}, \overrightarrow{\mathrm{x}}}\left[\frac{1}{2}\|\overrightarrow{\mathrm{~b}}-\mathrm{A} \overrightarrow{\mathrm{x}}\|_{2}^{2}\right] \quad \text { subject to } \mathrm{A} \geq 0, \overrightarrow{\mathrm{x}} \geq 0
$$

Idea: Fix A and b ,

## IMAGE PREDICTION BASED-ON NMF

We can write NMF cost function in the vector form

$$
\min _{\mathrm{A}, \overrightarrow{\mathrm{x}}}\left[\frac{1}{2}\|\overrightarrow{\mathrm{~b}}-\mathrm{A} \overrightarrow{\mathrm{x}}\|_{2}^{2}\right] \quad \text { subject to } \mathrm{A} \geq 0, \overrightarrow{\mathrm{x}} \geq 0
$$

Idea: Fix A and b ,
Find an NMF representation of the support region, and approximate the unkown block with the same parameters

## IMAGE PREDICTION BASED-ON NMF

We can write NMF cost function in the vector form

$$
\min _{\mathrm{A}, \overrightarrow{\mathrm{x}}}\left[\frac{1}{2}\|\overrightarrow{\mathrm{~b}}-\mathrm{A} \overrightarrow{\mathrm{x}}\|_{2}^{2}\right] \quad \text { subject to } \mathrm{A} \geq 0, \overrightarrow{\mathrm{x}} \geq 0
$$

Idea: Fix A and b ,
Find an NMF representation of the support region, and approximate the unkown block with the same parameters

$$
\min _{\vec{x}: \vec{x} \geq 0}\left[\frac{1}{2}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2}\right]
$$

$\|\| \nabla$

## IMAGE PREDICTION BASED-ON NMF

We can write NMF cost function in the vector form

$$
\min _{A, \vec{x}}\left[\frac{1}{2}\|\overrightarrow{\mathrm{~b}}-\mathrm{A} \overrightarrow{\mathrm{x}}\|_{2}^{2}\right] \quad \text { subject to } \mathrm{A} \geq 0, \overrightarrow{\mathrm{x}} \geq 0
$$

Idea: Fix A and b ,
Find an NMF representation of the support region, and approximate the unkown block with the same parameters

$$
\min _{\vec{x}: \bar{x} \geq 0}\left[\frac{1}{2}\left\|\vec{b}_{c}-A_{c} \vec{x}\right\|_{2}^{2}\right] \quad x_{a} \leftarrow x_{a} \frac{\left(A_{c}^{T} \vec{b}_{c}\right)_{a}}{\left(A_{c}^{T} A_{c} \vec{x}\right)_{a}+10^{-9}}, a=1 \ldots M
$$

## IMAGE PREDICTION BASED-ON NMF

We can write NMF cost function in the vector form

$$
\min _{A, \vec{x}}\left[\frac{1}{2}\|\overrightarrow{\mathrm{~b}}-\mathrm{A} \overrightarrow{\mathrm{x}}\|_{2}^{2}\right] \quad \text { subject to } \mathrm{A} \geq 0, \overrightarrow{\mathrm{x}} \geq 0
$$

Idea: Fix A and b ,
Find an NMF representation of the support region, and approximate the unkown block with the same parameters

$$
\begin{gathered}
\min _{\overrightarrow{\mathrm{x}}: \overline{\mathrm{x}} \geq 0}\left[\frac{1}{2}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2}\right] \quad \mathrm{x}_{\mathrm{a}} \leftarrow \mathrm{x}_{\mathrm{a}} \frac{\left(\mathrm{~A}_{\mathrm{c}}^{\mathrm{T}} \overrightarrow{\mathrm{~b}}_{\mathrm{c}}\right)_{\mathrm{a}}}{\left(\mathrm{~A}_{\mathrm{c}}^{\mathrm{T}} \mathrm{~A}_{\mathrm{c}}\right)_{\mathrm{a}}+10^{-9}}, \mathrm{a}=1 \ldots \mathrm{M} \\
\hat{\mathrm{~b}}_{\mathrm{t}}=\mathrm{A}_{\mathrm{t}} \overrightarrow{\mathrm{x}}_{\text {opt }}
\end{gathered}
$$

$\|\left|{ }_{\|}\right|$

## EXPERIMENTAL RESULTS COMPRESSION EFFICIENCY

Foreman (CIF)

Cameraman (256x256)

OMP is iterated 8 iterations. Iteration number is Huffman encoded. Prediction residue is transform encoded as in JPEG. (8x8 block size.) The quantization is weighted by a factor (QP) varying between $10 . . .90$.

## Impose a sparsity constraint on NMF

$\mathcal{R I N R I A}$

## IMAGE PREDICTION BASED-ON NMF

Constraint: Use only k-NN patches, and keep track of the sparse vectors to optimize the prediction ( $k=1$... $K$ )

## IMAGE PREDICTION BASED-ON NMF

Constraint: Use only k-NN patches, and keep track of the sparse vectors to optimize the prediction ( $k=1$...K)

$$
\begin{aligned}
\overrightarrow{\mathrm{x}}_{\text {opt }}=\min _{\overrightarrow{\mathrm{x}} \times \mathrm{x} \geq 0}\left[\frac{1}{2}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2}\right] & \text { subject to } \\
& \min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{t}}-\mathrm{A}_{\mathrm{t}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} \text { and }\|\overrightarrow{\mathrm{x}}\|_{0} \leq \mathrm{K}
\end{aligned}
$$

## IMAGE PREDICTION BASED-ON NMF

Constraint: Use only k-NN patches, and keep track of the sparse vectors to optimize the prediction ( $k=1$...K)

$$
\begin{aligned}
\overrightarrow{\mathrm{x}}_{\text {opt }}=\min _{\overrightarrow{\mathrm{x}} \mathrm{x} \geq 0}\left[\frac{1}{2}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2}\right] & \text { subject to } \\
& \min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{t}}-\mathrm{A}_{\mathrm{t}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} \text { and }\|\overrightarrow{\mathrm{x}}\|_{0} \leq \mathrm{K}
\end{aligned}
$$

The selected $k$ value needs to be transmitted so that the decoder can run with the same number of patches

## IMAGE PREDICTION BASED-ON NMF

Constraint: Use only k-NN patches, and keep track of the sparse vectors to optimize the prediction ( $k=1$... $K$ )

$$
\begin{aligned}
\overrightarrow{\mathrm{x}}_{\text {opt }}=\min _{\vec{x}: \bar{x} \geq 0}\left[\frac{1}{2}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{c}}-\mathrm{A}_{\mathrm{c}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2}\right] & \text { subject to } \\
& \min _{\overrightarrow{\mathrm{x}}}\left\|\overrightarrow{\mathrm{~b}}_{\mathrm{t}}-\mathrm{A}_{\mathrm{t}} \overrightarrow{\mathrm{x}}\right\|_{2}^{2} \text { and }\|\overrightarrow{\mathrm{x}}\|_{0} \leq \mathrm{K}
\end{aligned}
$$

The selected $\boldsymbol{k}$ value needs to be transmitted so that the decoder can run with the same number of patches

The predicted signal: $\hat{b}_{t}=A_{t} \vec{x}_{\text {opt }}$
$\square$
